## **Evapo-Rust Provides Speedy, Safe Remedy for Corroded Vault Door Gear**

(Birmingham, AL) -- George Ash is in the business of providing unique solutions to his industrial customers. As Corrosion Technician at Fulton Enterprises, Inc., a business that provides diverse packaging and engineering services, and is also a Daubert Cromwell distributor, he often runs into challenging problems that customers look to him to fix.

For example, a custom metal gear manufacturer came to Ash with a very large vault door part that had thoroughly rusted due to a roof leak. The corrosion was deeply embedded in the threaded bolt holes, keyways, and teeth of this hefty 5" thick and 18" diameter gear.

Another wrinkle—this impressive part had a shiny mirror finish designed to showcase the door's operating mechanism. The mirror finish was corroded as well. It was impossible to use any kind of abrasive rust removal method without ruining it.

"It was a real mess," says Ash, who brought along a sample container of Daubert Cromwell's new Evapo-Rust on his visit to see the gear. "Our client had actually found out about the product on their own through the internet, so I was glad to visit their facility and bring some along to see if it could help."

After testing Evapo-Rust on a similar metal surface, Ash immersed the rusted mirror-finish vault door gear in a bucket of Evapo-Rust, and then accompanied his customer on a plant tour. They returned 90 minutes later to find the mirror finish gear in pristine condition.

"We were ecstatic," says Ash. "The result was complete restoration without damage to the mirror finish. Bolt holes, keyways, and gear teeth were corrosion-free. Even the stamped lettering on the face of the gear was perfectly restored."

Because Evapo-Rust is a non-acidic, non-toxic, water based solution that works without scrubbing, it had soaked off the rust without damaging the finish. Evapo-Rust's neutral pH formulation doesn't affect metal compositions, plating, or non-oxide paint coatings.

"Evapo-Rust can help me save on labor costs," the gear company representative told Ash. "There's virtually no manpower involved in restoring rusted parts because once you submerge them, it does the work for you. Also, it prevents corrosion for several days after treatment with Evapo-Rust, which was an added bonus."

He was also impressed that Evapo-Rust is environmentally friendly, safe to use and easy to dispose. It gets the highest ratings of "zero" in the product hazard categories of health, fire, toxicity, and reactivity on the all-important Material Safety Data Sheet that all manufacturing plants require of new materials.

"Evapo-Rust is about as much fun as it is effective. It helped my client out of a jam," says the lively, affable Ash as he readies an appropriate quip.... "You could say it got him out of a real door jam."
